

Final Project Assignment — Game Design

Capstone Project

Objective

For the final exam of this course, you will create and present a complete game project as if you were a real game development studio.

Your task is not only to create a game idea, but also to prove that your game works through documentation, prototype development, testing, balancing, and professional presentation.

This is your final opportunity to demonstrate everything you have learned during the semester: game mechanics, storytelling, balancing, prototyping, UI/UX, monetization, and game production planning.

Project Format

You may work individually or in groups.

Recommended group size:

2–3 students

Each student/group must create an ORIGINAL game project.

Accepted game types:

- Board Game
- Card Game
- Mobile Game
- PC Game
- Console Game
- Educational Game
- Multiplayer Game
- Party Game
- Strategy Game
- Puzzle Game

You may continue improving your previous semester project or create a completely new one.

Individual Project vs Group Project

If You Work ALONE (1 Student)

You are required to complete:

Game Design Document (GDD) + Final Pitch Presentation

Since this is an individual project, your focus will be on creating a strong, professional, and detailed game design document and presenting your game idea clearly.

Required length:

Minimum 10–15 pages

Your GDD must be complete, detailed, and professionally structured.

A weak or short document will significantly affect your final grade.

You must also prepare a professional pitch presentation of your game.

If You Work IN A GROUP (2–4 Students)

You must complete the FULL project:

GDD + Prototype + Playtesting + Final Pitch Presentation

Since group work allows more division of responsibilities, expectations are much higher.

This should feel like a small real game studio project.

Required Deliverables for INDIVIDUAL PROJECTS

1. Game Design Document (GDD)

Create a professional Game Design Document similar to real game studios.

Required length:

Minimum 10–15 pages

Required sections:

1. Game Overview

- Game title
- Genre
- Platform
- Target audience
- Elevator pitch
- Core idea

2. Core Gameplay Loop

Explain what the player does repeatedly.

Example:

Explore → Fight → Upgrade → Unlock → Progress

3. Game Mechanics

Include major systems such as:

- movement
- combat
- economy
- progression
- leveling
- crafting
- puzzle systems
- resource management

(depending on your game type)

4. Story and World

- setting
- lore
- story structure
- world rules

5. Characters

- protagonist
- enemies
- NPCs
- bosses
- factions

6. Level Design

- progression
- map structure

- stages
- difficulty scaling

7. UI / UX Design

- HUD
- menus
- tutorial system
- player feedback

8. Art Style and Audio

- visual references
- art direction
- atmosphere
- sound design
- music style

9. Monetization Strategy

Explain:

- premium model
- DLC
- cosmetics
- battle pass
- ads
- subscriptions

and justify your choice.

10. Technical Scope

- engine/tools
- team roles
- estimated development timeline

11. Competitor Analysis

Compare your game with at least 3 existing games.

Explain:

- similarities
- differences
- unique selling point
- why players would choose your game

2. Final Presentation (Pitch)

Each student must prepare a professional presentation.

Presentation time:

5–7 minutes

Present your project like a game designer pitching to investors or a studio.

Include:

- game concept
- strongest mechanics
- monetization plan
- competitor analysis
- why players would enjoy your game

If possible, include:

- sketches
- UI concepts
- gameplay flow diagrams
- visual references

Required Deliverables for GROUP PROJECTS

1. Game Design Document (GDD)

Create a professional Game Design Document similar to real game studios.

Required length:

Minimum 10 pages

(Sections remain the same as above)

2. Playable Prototype

You must create a prototype that demonstrates your core gameplay.

For Board/Card Games:

- board/cards/components
- playable rules
- balancing system

For Digital Games:

- Unity / Unreal / Godot / Construct prototype

- vertical slice
- small playable demo

For Mobile Games:

- gameplay prototype
- UI flow
- interaction system

Prototype does not need to be a full game, but it must clearly demonstrate your main gameplay systems.

3. Playtesting Report

You must test your game using real players.

Requirements:

Minimum 10 playtesting sessions

You must collect:

- gameplay statistics
- balance observations
- player feedback
- survey results

Then explain:

- what problems were found
- what improvements were made
- what you would fix in the next version

This part is extremely important.

4. Final Presentation (Pitch)

Each group must prepare a professional presentation.

Presentation time:

8–10 minutes

Present your project like an indie studio pitching to investors.

Include:

- game concept
- strongest mechanics

- prototype demonstration
- monetization plan
- competitor analysis
- why players would enjoy your game

If possible, include:

- trailer
- gameplay video
- live demo

Submission Format

Individual Students Submit:

- GDD (PDF)
- Presentation Slides

Group Projects Submit:

- GDD (PDF)
- Prototype files
- Playtesting Report
- Presentation Slides

All files must be clearly organized and named.

Grading Criteria (100 Points)

Individual Project

Category	Points
Game Idea Quality	20
Mechanics Design	20
GDD Completeness	20
Creativity & Innovation	15
Competitor Analysis	10
Presentation Pitch	15

Group Project

Category	Points
Game Idea Quality	15
Prototype Quality	15
Mechanics & Balance	10
Playtesting Quality	15
GDD Professionalism	20
Creativity & Innovation	10
Presentation Pitch	10
Competitor Analysis	5

Important Notes

- Copying existing games without meaningful improvements is not allowed.
- Originality matters.
- Professional presentation matters.
- Clear design thinking matters more than visual beauty.
- Weak testing = weak final grade.

This is your final project and should represent your best work of the semester.

Treat it like a real studio project.

Good luck.
